FIGURE 10

Wetland Wetland Inventory (WAI) maps show general representations of the type, size and location of wetlands in Wisconsin. These maps have been prepared from the analysis of digital aerial imagery in conjunction with soil surveys, topographic maps, ground water elevations, and field work. State includes defining a wetland as "an area which water is at or above the land surface long enough to the capable of supporting aquatic or hydrophytic vegetation and/or soil with distinctive wet conditions." The principal focus of the WAI is to produce wetland maps that are practical representations of the type, size and location of wetlands in Wisconsin. While this reflects the objective of the WAI to produce reconnaissance-level information on the location, type, size of these habitats, such that they are accurate at the regional scale of the 1:24,000 (1 inch = 2400 feet) scale maps. The DNR recognizes the limitations of being remotely sensed information as the primary data source. They are to be used as a guide for planning purposes. These maps are not intended to be used in lieu of a professional survey or to determine the extent of jurisdiction of any Federal, State or local government, or to establish the jurisdictional base of any regulatory program of government agencies. Federal activities involving jurisdiction, whether or not subject to wetland laws, should seek the advice of appropriate Federal, State, or local agencies concerning specified agency regulatory programs and jurisdictions that may affect such activities. The most accurate method of determining the legal extent of a wetland for Federal or State regulations is a field delineation of the wetland boundary by a professional trained in wetland delineation techniques.
